

To Whom It May Concern,

As Director of the Laboratory at the College of Engineering Science and Technology, Shanghai Ocean University, I strongly recommend Mr. Xiong Yang for your graduate program. Serving as his advisor for various tech competitions, innovation projects, and the "Blue Innovation Club" since his freshman year, I have witnessed his extraordinary self-motivation, execution capability, and mature leadership, placing him among the very best student leaders and engineers I have mentored throughout my career.

Although Yang initially joined the "Blue Innovation Club" as a regular member, his remarkable efficiency led me to recommend him for a leadership role. He ultimately became President of this 400-member club. He institutionalized monthly tech-sharing sessions and weekly research meetings, where he skillfully managed hardware/software resources and assisted me in mentoring other teams—troubleshooting technical bottlenecks and refining business strategies. Such mature project management is incredibly rare among undergraduates.

Academically, Yang achieved top grades (full marks) in Mobile Robot Innovation Practice and Analog Electronic Technology Experiment. During his lab sessions under my management, his exceptional practical engineering proficiency and profound curiosity in Robotics and Embodied AI deeply impressed me. Consequently, he voluntarily immersed himself in my lab's research, working intensively alongside graduate students and fully adapting to the rigorous pace of graduate-level research.

As team captain, he led two key projects: the Municipal-level "Intelligent Delivery Bipedal Robot" and the "Intelligent Bipedal Inspection & Picking Robot." Beyond managing personnel and business plans, he was the core developer. He built a standard high-level and low-level control architecture: utilizing ROS on Ubuntu, he deployed multi-sensor fusion navigation on the main computer (Jetson Nano) and achieved precise hardware control via the low-level microcontroller (STM32). Furthermore, he leveraged YOLO and OpenCV for robust object detection, successfully constructing a complete technical stack from visual perception to item grasping.

Leveraging these technical strengths, Yang led his team to win prestigious awards, including First Prizes in the CIMC "Siemens Cup" Intelligent Manufacturing Challenge (National Preliminary) and the iCAN Innovation Contest, plus a Second Prize in the National Energy Saving & Emission Reduction Competition. During defenses, his deep insight into underlying algorithms and hardware consistently earned high praise from judges.

In summary, Yang possesses robust engineering capabilities, sharp systems thinking, and mature leadership. I am firmly convinced that he is fully prepared for the rigorous academic and practical demands of your master's program and holds immense potential in Embodied AI and Robotics. I highly recommend him without reservation.

Sincerely,

Wu Qingyun
